STEP UP TRANSFORMER TESTING

Patented in 1950, popularised in 2019, and perfected in 2024, the technology within the TAU3 provides reliable results by removing inaccuracy associated with test voltage and leads. The TAU3 automatically applies the proper test voltage and shorting connections, ensuring repeatable results.

PROBLEMS TYPICALLY FOUND WITH THE TAU3

- Loose connections
- Turn-to-turn shorts
- Broken strands
- Winding deformation
- Tap changer contact problems
- Core problems

The TAU3 has been designed with a diagnostic mode, where the operator can focus on problem phases and unique tests for pinpointing and confirming where issues exist in the asset.

SAFE WITH THREE-PHASE STEP UP

Safety is the first priority at Megger, which is why the TAU3 is CE Certified to IEC 61010 - Safety requirements for electrical equipment for measurement, control, and laboratory use. During a test, software will perform safety checks before applying full test voltage. In addition, the TAU3 utilizes modern hardware to protect the asset and operator in the event of faults.

DETAILED DESCRIPTION

The TAU3 is designed to test all power, instrument (CTs and PT/VTs), and distribution transformers. With minimal input from the user, the TAU3 uses patent pending step up excitation to deliver the required AC/DC voltage and current to obtain accurate results.

With simultaneous three-phase excitation, testing completes faster and safer than switched three-phase and single-phase instruments. A single ladder climb and one-time lead connection reduces time spent on top of transformers. Once connected to the transformer, a key lock, safety interlock, and an emergency stop ensure testing starts and stops safely.

Shock mounted electronics are housed in a compact, wheeled, and water tight case that's up to 75 % lighter/ smaller than other multifunction electromechanical test solutions.

Find vector / polarity recognition

Find vector provides confidence in transformer results by performing vector group discovery and validation before every test. Windings such as zigzag, can be mistakenly seen as a delta, so the operator is required to validate the intended winding to be measured. Failure to do so could have catastrophic consequences when system voltage energizes the transformer.

TTR - Turns ratio testing

When compared to traditional single-phase step down test instruments, the user is no longer required to know the proper test voltage required to obtain a valid result when using the TAU3. The TAU3 utilises three-phase step up ratio technology, providing safe, repeatable, and reliable results. When the TAU3 detects an issue with a phase, a diagnostic mode allows pinpointing of issues where traditional ratio instruments fail to operate/test.

Excitation current

Included with turns ratio testing, the excitation current test is extremely useful in locating problems such as defects in magnetic core balance, magnetic core structure, shifting of windings, failures in the turn-to-turn insulation, or problems in tap changers.

Phase angle deviation

Phase angle deviation (not to be confused with phase shift) is the phase relationship between in-phase vectors of the high side versus the low side windings. Phase deviation denotes the quality of the core and the winding, and when functioning properly should exhibit very low values (< 0.1°). Shorted or partial shorted turns and/or a deteriorated or damaged core can cause significant changes in the phase deviation values.

Magnetic balance

Magnetic balance assess the health of the windings, core assembly condition, and flux distribution within the transformer. This test, performed safely and efficiently by the TAU3, is a measure of how well balanced (electrically) the transformer is versus nameplate specifications.

Winding resistance

Efficiently test winding resistance with three-phase dual winding DC output of the TAU3. 100 V DC open circuit voltage quickly saturates the transformer core as independent current sources for H and X channels deliver stable and accurate measurements for each winding under test. No lead changes are required to switch from phase to phase - select auto save and the TAU3 does all the work. If one phase is out of limits, the user interface simplifies investigation by highlighting the problem phase and guiding the user through the results validation process.

OLTC make before break continuity

When performing winding resistance tests across multiple OLTC taps, make before break testing automatically verifies continuity of the tap changer connections. This first level diagnostic mode is useful in determining when dynamic resistance measurements are appropriate for further investigation.

Automatic adaptive demagnetization

Adaptive demagnetization removes remanence (magnetization) that remains after winding resistance tests are complete. The TAU3 avoids costly nuisance trips of protection equipment with automatic demagnetization performed after each winding resistance test.

Short circuit impedance

Three-phase patent pending internal shorting and lead compensation means that the connection requirements for short circuit impedance tests are the same as all the other tests - completed with one ladder climb.

Phase shift measurements

Today's industrial power systems and utility power grids utilise transformers with multiple secondaries with differing phase angles in various vector configurations, including zigzag windings. The new TAU3 handles each phase displacement as easily as standard three-phase transformer vector configurations, and provides independent results for each phase.

One-Touch OLTC

Save time testing with One-Touch OLTC. Connect to the transformer OLTC with the included cables and run through an entire OLTC with one click. One-Touch OLTC is available for both AC and DC, providing maximum test efficiency.

SOFTWARE, SAVING, AND PRINTING

Minimise training time with the intuitive 10.1in user interface of the TAU3. Large, self-explanatory buttons guide operation, while on screen vectors provide reassurance that the transformer nameplate matches the test setup. When exported, results are grouped by file name, producing an XLSX/PDF report that is easy to read, email, or import into PowerDB. When needed, the optional USB printer can print results on demand.

When you connect the TAU3 to your PC, not only can you control the device, but a USB drive will appear. The user manual, datasheet, and TAU3 PC application installer can be found on this drive so you always have the necessary documentation and applications on hand.

Frequency response stray losses (FRSL)

Frequency response stray losses is a short circuit test performed at different frequencies. As with other variable frequency tests, additional diagnostic information is available when looking at frequencies other that 50 or 60 Hz.

PowerDB control*

If you're looking to step up your reporting, use PowerDB to configure and execute your tests. With PowerDB you can produce consistent test reports from all of your Megger instruments.

Dynamic resistance measurements (DRM)*

Dynamic resistance measurements are an advanced diagnostic test for on-load tap changers. Pinpoint issues in on-load tap changers with individual resistor values and vibration and motor current profiles.

Heat run – internal temperature*

Winding resistance cool down is an advanced diagnostic tool to determine the maximum temperature of a winding immediately after removal from full power.

Dry out – internal temperature*

A transformer may need to go through a dry out process before going into service. This dry out process requires the internal temperature to remain steady for a set amount of time. Provide a reference temperature and resistance, and the TAU3 will report the temperature of the winding.

Transformer losses / efficiency

Realise a transformers impact on transmission and distribution utilisation and revenue with the transformer efficiency test. Measurements adjusted for temperature and expected load provide distinct efficiency profiles for each transformer. Per phase load and no-load losses provide additional diagnostic information for those looking to get the most out of their renewable networks.

Custom application control

With custom app control, any program can control the TAU3 through the API. Great for organisations looking to push their test program to the limit! Nondisclosure agreement required for access to the API.

UNIVERSAL LEAD SET

The three-phase universal lead set simplifies connecting to any transformer. The durable kelvin clamps extend up to 3 in for connecting to any bushing size. Lead spans range from 5 m (15 ft) to 30 m (100 ft), ensuring secure connection and test capabilities for all transformer shapes and sizes. Connecting all leads in one ladder climb greatly reduces the risk of fall injuries and test time. Existing customers are able to use legacy lead sets with the TAU3. See the tables to the right for details.

The kelvin clamps also accept safety banana plugs, simplifying connection to a CT terminal block. Clearly displayed electrical shock and potential markings on the clamp inform operators how to connect safely and securely.
